Claim 6; Fig 4; 100pp; English.

A full-length cDNA clone (T17375) codes for Bcl-Y (R81451), a protein that induces apoptosis in cells and functions as a negative regulator of Bcl-2 function. It was isolated from a Jurkat cell cDNA library using as probe a partial Bcl-Y cDNA clone obtd. by PCR of DNA derived from the Namalwa cell line. The cDNA can be used for prodn. of recombinant Bcl-Y, as a probe, to produce transgenic animal models, and in the gene therapy of disorders characterised by inappropriate cell proliferation or cell death.

Southern blot analysis of human genomic DNA and a panel of human, rodent somatic cell DNAs revealed at least 3 Cdn-related genes residing on chromosomes 6, 11 and 20. Cdn-3 (R77878) did not contain the structural features of Cdn-1 (R77876), Cdn-2 (R77877) or other Bcl-2 family members.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Natilureic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B. NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the produ. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of matriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             599 cnrgsnndnnndsnnndwmnrysnnndnvkgmannhnsnnsshgsnkssncvvdsrnvn

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having quanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the produ. Of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              530 ahgkynnnantghnkgnvvankhvnkkrnnntrnvnnnnkhmrdvnnnhntrnngacndn

                                                                                                                                                                                                                                                                                          Introducing random point mutations into nucleic acods - by prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening.
                                                                                                                                                                                                                                                                                                                                                                 Random point mutations were introduced into the alpha fragment of Erodia beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonuclectide probe MKI4-A consists of nuclectides 5-95 of MKI4 (Q51735). It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           - used for

Introducing random point mutations into nucleic acods -

Introducing random point mutations into nucleic acods -

The preparation of suppletion of molecules and screening.

The standom point mutations were introduced into the alpha fragment of

E. Coll beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oliqonucleotide was hybridised to

It to generate a popn of DNA molecules which terminate at all

C. possible nucleotide positions within a specified region. The

C. variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the

C. transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable took-vector system

The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô

It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59.

screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; page 35, 255pp; English.

070466 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generate formula can also be represented as follows:X(NNB)1(TGC)(NNB)10(TGC)2(NNB)4Z(NNB)8(TGC)(NNB)9.

9Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in 070466-68. Other specified secretated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compons. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               908 GCATCAATTGGGGCCGTGTGGTGGCTCTTCTGGGCTTCAGCTACCGTCTGGCCCTACACA 967

CC 70467 is a generic DNA sequence used to generate random TSAR (Totally Stribetic Affiliaty Readents) peptides. This generate formula can also be crepresented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)17. X and Y are flanking restriction sites (X is not the same as Y) that are constructed by these generic sequences are shown in CK65151-54. TSARS are concatenated by these generic sequences are shown in CK65151-54. TSARS are concatenated by these generic sequences are shown in CK65151-54. TSARS are concatenated by these generic sequences are shown in CK65151-54. TSARS are concatenated by these generic sequences are shown in CK65151-54. TSARS are concatenated by these generic sequences are shown in CK65151-54. TSARS are concatenated by these generic sequences are shown in CK65151-54. TSARS are concatenated as binding domain with a affinity for a ligand and a second effector peptide portion that is chart the expressed peptide contains. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cystesine residues positioned in, or flanking, the unpredicted or variant residues. These residues comprise, peptide, toxin or enzyme, to the specific target or on the concatenated and also replace the function of macromolecules, eg.

CCC11. Thy can also replace the function of macromolecules, eg.

heart, Lambda ZAP Express vector-Lambda ZAP Express host-E. Coll XL1-Blue Rsitel-EcoRI Rsite2-XhoI mRNA was purified from human fetal hearts (8-10 weeks). CDNA was synthesized using a XhoI-Oligo digastion with XhoI, for directional cloning into predigested lambda ZAP Express.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 (bases 1 to 270)

rat primer=M13 Reverse library=Rat PC-12 cells, untreated vector=pBluescript SK- Rsitel=EcoRI Rsite2=XhoI poly(A)+ RNA was purified from untreated PC12 cells cultured for 9 days. cDNA was constructed using an oligo-dT primer and directionally cloned using the Lambda 2AP II Vector Kit by Stratagene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria; Rodentia; Sciurognathi; Myomorpha; Muridae; Murinae; Rattus.

Second strand was prepared using RNase H and DNA polymerase I. ECOR I adapters were ligated to the CDNA, and it was digested with Xho I. Prepared fragments were ligated into ECOR I + Xho I digested lambda ZAP II vector."

/note="Vector: Lambda ZAP II; Site_1: EcoR I; Site_2: Xho I; PolyA+ RNA, from asynchronous blood stage parasites of the Dd2 isolate cultured in vitro, was reverse transcribed using an oligo dT-Xho I primer. Second strand was prepared using RNase H and DNA polymerase I. EcoR I adapters were ligated to the cDNA, and it was digested with Xho I. Prepared fragments were ligated into EcoR I Xho I digested lambda ZAP II vector."

ALIGNMENTS

protein

Sisclosure; Fig 2: 24pp; English.

This Bak-2 protein sequence represents a bcl-1 homologue which
interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1

Enteracts with Epstein-Barr virus (EBV) early lytic cycle BHRF1

Enteracts with Epstein-Barr virus (EBV) early lytic cycle BHRF1

Enteracts with Epstein-Barr virus (EBV) early lytic cycle BHRF1

Enteracts and is capable of modulating apoptosis. The protein may protein, in a new virucide drug screening method, which involution of Bak-2 protein and a viral protein (e.g. EBV BHRF1).

Exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELSA. Interaction of Bak-2 and viral proteins allows viral replication or latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or N-PSDB; 742139. Screening for anti-viral agents - by detecting the ability of an agent to disrupt the interaction of a Bak protein and a viral Bak-2 protein.                                                                                                                                                                                                                                                                                                                                           Cdn-2 CDNA was isold. from a human placental genomic library using a 950 bp fragment of Cdn-1 CDNA. Expression of Cdn-2 in mouse progenitor B-cell FL5.12 cells decreased IL-3-induced apoptosis. The Cdn-2 protein displayed 97% amino acid identity with Cdn-1 (R77876).

New nucleic acid sequences encoding Cdn apoptosis modulators - and related vectors, transformed cells, proteins and antibodies, useful or diagnosis and treatment e.g. of HIV infection, reperfusion injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 masgqgpgpprqecgepalpsaseeqvaqdteevfrsyvfyrhqqeqeaegvaapadpem 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This Bax protein sequence represents a bcl-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1 protein, and is capable of modulating apoptosis. The protein may be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bak protein and a viral protein (e.g. EBV BHRF1), exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction of Bak and viral proteins allows viral
                                                                                                                                                                                                                                                                                                                                                 Disclosure; Fig. 3A-B; 66pp; English.

Cdn-1 CDNA was isolated from a human heart CDNA library using a previously isolated clone as probe. Recombinant Cdn-1 was produced in Sf9 and human colon adenocarcinoma HT29 cells. Expression of cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; Bak; apoptosis; latency; virus replication;

Bcl-Y protein (R81451) is a member of the Bcl-2 family and can induce apoptosis in cells and function as a negative regulator of Bcl-2 function. Bcl-Y mRNA was detected in all human tumour cell lines examined and is also widely expressed in primary human tissues. It can be obtd. by expression of a full-length cDNA clone (T17375) in pref. mammalian host cells. Bcl-Y can be used to develop prods. for treating disorders associated with inappropriate cell proliferation or cell death, and to raise antibodies used for

New nucleic acid sequences encoding Cdn apoptosis modulators - and related vectors, transformed cells, proteins and antibodies, useful or diagnosis and treatment e.g. of HIV infection, reperfusion injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          etc.
Disclosure; Fig.11; 66pp; English.
Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Ras-mediated apoptosis. Deletion of the N-terminal 59 amino acids of Cdn-1 only slightly decreased this activity, suggesting that small, truncated Cdn-1 molecules may be potent therapeutics.

neuronal cells, lymphocytes and cancers
Claim 4; Page 87; 127pp; English.
Claim 4; Page 87; 127pp; English.
This protein may be expressed recombinantly, particularly with pcmV plasmids as vectors for expression in mammalian cell cultures.
The protein has particular application in cancer cells (failure of programmed cell death (PCD)) or neurodegenerative and autoimmune diseases
                                                                                                                                                                                                                                                                                             Chinadural G;

WINCIALC acids encoding apoptosis regulating proteins - useful for diagnosing and treating immune disorders, malignancies, etc.

Example 8; Page 34-35; 60pp; English.

CC The 80-6 mutant (W01020) of the bcl-2 oncogene product (W01018)

CC lacks amino acids 80-86 of the native protein. This and other

CC lacks amino acids 80-86 of the native protein. This and other

CC commine the interactions between Bcl-2 and novel apoptosis-

CC commine the interactions between Bcl-2 and novel apoptosis-

CC camine the interactions defined that are essential for interaction with the Nip proteins. These motifs show homology

CC interaction with the Nip proteins. These motifs show homology

CC apoptosis-blocking protein (W01010).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 48 ffssgpghtphpaasr-dpvartsplgtpaapgspvppvvhltlrgagddfsrryrrdfa 106

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure: Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis. Truncated Cdn-1 derivatives given in R77879-81 were used to test the effects of deleting the N-terminal sequences of Cdn-1
                                                                                  Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis. Deletion of the N-terminal 70 amino acids of Cdn-1 improved this activity, suggesting that small, truncated Cdn-1 molecules may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic acid sequences encoding Cdn apoptosis modulators - and

Inducting or preventing death of T cells by bcl-XL protein regulation or preventing death of HIV infected cells or to down:regulate immune responses in immune diseases

Tused to increase survival of HIV infected cells or to down:regulate immune responses in immune diseases

Disclosure; Page 52-53; 76p; English.

This is the sequence of a human bcl-XL protein, which protects

Thymphorytes against cell death. A splice variant form, bcl-XS, lacks a stretch of 63 amino acids, and is a dominant negative regulator of bcl-XL function. The gene may be modified to facilitate interaction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BHI and/or BHZ. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo via gene transfer using a vector for HIV infection gene therapy, to augment intracellular bcl-XL protein levels and protect from cell death. A corresponding therapy of e.g. autoimmune disease, graff rejection or graft-versus-host disease, to induce cell death (e.g. apoptosis) and down-regulate the immune response in a T-lymphocyte population.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            83 maavkqalreagdefelryrrafsdltsqlhitpgtayqsfeqvvnelfrdgvnwgriva 142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     143 ffsfggalcvesvdkemqvlvsriaawmatylndh-lepwiqenggwdtfvelygnna 199
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding apoptosis regulating proteins - useful for diagnosing and treating immune disorders, malignancies, etc.
Example 8; Page 33-34; 60pp; English.
The 42-8 mutant (W1019) of the bcl-2 oncogene product (W01018)
lacks amino acids 42-48 of the native protein. This and other Bcl-2 mutants (see also W01020-21) were used in a two hybrid assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-DEC-1996 (first entry)
Apoptosis-blocking protein Bcl-2 mutant 42-8 (del42-48).
Apoptosis-regulating protein; Bcl-2; oncogene; adenovirus BlB 19K protein; cell death; cancer; tumour; immune disorder; diagnosis; therapy; Bipla; Bipl3; Bip5; NIP1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ä

Nucloic acids encoding apoptosis regulating proteins – useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnosing and treating immune disorders, malignancies, etc.
Example 8; Page 32-33; 60pp; English.
The bcl2 oncogene product (W01018) enhances the survival of haematopoietic B and Teells by blocking apoptosis induced by diverse agents. Its activity is similar to that of the 19k portein (W01010) of adenovirus Elb 3 Novel proteins, Bipla, Bipl3 and Bip5 (W0100-02), that specifically interact with Bcl-2, have been identified. Mutational analysis (see also W0109-79) associate with Bcl-2 at specific sites (see also W0109-79) associate with Bcl-2 at specific sites (see also W01093-04) that show homology to motifs (W01005-06) on 19k.
                   regulating proteins Nipl, Nip2 and Nip3 (W00997'99). The Nip proteins were unable to interact with mutant 42-8. The site of deletion in this mutant corresponds to a motif (see also W01003) on Bcl-2 essential for interaction with Nip proteins. A second binding motif (W01004) of Bcl-2 was also identified, and both show homology to motifs (W01005-06) found on the 19K protein (W01010) of edenovirus ElB.
                                                                                                                                                                                                                                                                                                                                                                                                           18-DEC-1996 (first entry)

Wethods for producing and identifying mutant bcl-2 proteins -
that lack death repressor activity and/or lacks binding to Bax.

By Disclosure; Page 40; 139p; English.

The sequences given in R71404-05 represent the human bcl-2 alpha and beta proteins respectively. bcl-2 is encoded by a proto-oncogene and care apportens respectively. bcl-2 is encoded by a proto-oncogene and care apportens respectively. bcl-2 is encoded by a proto-oncogene and care apportens respectively. bcl-2 is encoded by a proto-oncogene and confined by enhancing the survival of hematopoietic cell systems. bcl-2 is a 26 kD membrane-associated cytoplasmic protein and is thought to function by enhancing the survival of hematopoietic cell systems. bcl-2 has not been shown to directly promote cell cycle progression nor does it necessarily alter the dose reponse to limiting concentrations of IL-3. bcl-2 has been shown to form heterodimers with a 21 kD protein. Bax. overexpressed Bax accelerates apportence cell death induced by cytokine deprivation in an IL-3 dependent cell line, and it also acts to counter the death repressor activity of bcl-2. Therefore, the ratio between bcl-2 and Bax determines cell survival or death collowing an apoptotic stimulus. The invention gives a mutant form of bcl-2 in which there is at least one amino acid substitution or deletion collowing an apoptotic stimulus. The inventor protein substantially incapable of binding Bax and/or incapable of death effector molecules. Up regulating bcl-21s beneficial in treatment and diagnosis of immunodeficiency diseases, including Alba and securors.

Consumers and include and ischaemic cell death.

CELL 74.597-608(1993).

-1- FUNCTION: DOMINANT REGULATOR OF APOPTOTIC CELL DEATH.

-1- ALTERNATIVE PRODUCTS: TWO ISOPORMS, BCX-X(L) (SHOWN HERE) AND BGL-X(S), ARE DERIVED BY ALTERNATIVE SPLICING.

-1- TISSUE SPECIFICITY: BCL-X(S) IS EXPRESSED AT HIGH LEVELS IN CELLS TAAT UNDERGO A HIGH RATE OF TURNOVER, SUCH AS DEVELOPING LYMPHOCYTES. IN CONTRAST, BCL-X(L) IS FOUND IN TISSUES CONTAINING LONG-LIVED POSTMITUTOTIC CELLS, SUCH AS ADULT BRAIN.

-1- SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

EQUCHI Y., EWERT D.L., TSUJIMOTO Y.;

NUCLEIC ACIDS RES. 20:4187-4192[1992).

-1- FUNCTION: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF VARIOUS STIMULI INDUCING CELLULAR DEATH. BLOCKS APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDARY TO PREVEWE APOPTOSIS AT SITES OF FREE RADICAL GENERALION SUCH AS MITOCHONDRIA.

-1- SUBCELLULAR LOCATION: MITOCHONDRIAL INNER MEMBRANE.

-1- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES.
                                                                                                                                                                                                                          1; Gaps
